

Human Sleeping Chamber

Abstract

The claimed invention is a human sleeping chamber for use in areas where either space is minimal, where additional soundproofing or privacy is desired or where the chambers may be temporarily placed due to inherent portability. The chambers feature a durable, soundproof, and weatherproof outer shell, encasing a mattress and various comforts desired in an overnight accommodation. The chambers may be adapted for permanent to semi-permanent placement, or for portability, such as for the back of vehicles or as temporary shelter in cases of emergency. The preferred embodiments also feature ventilation, heating and cooling systems.
